

Caltech sustainability

emissions

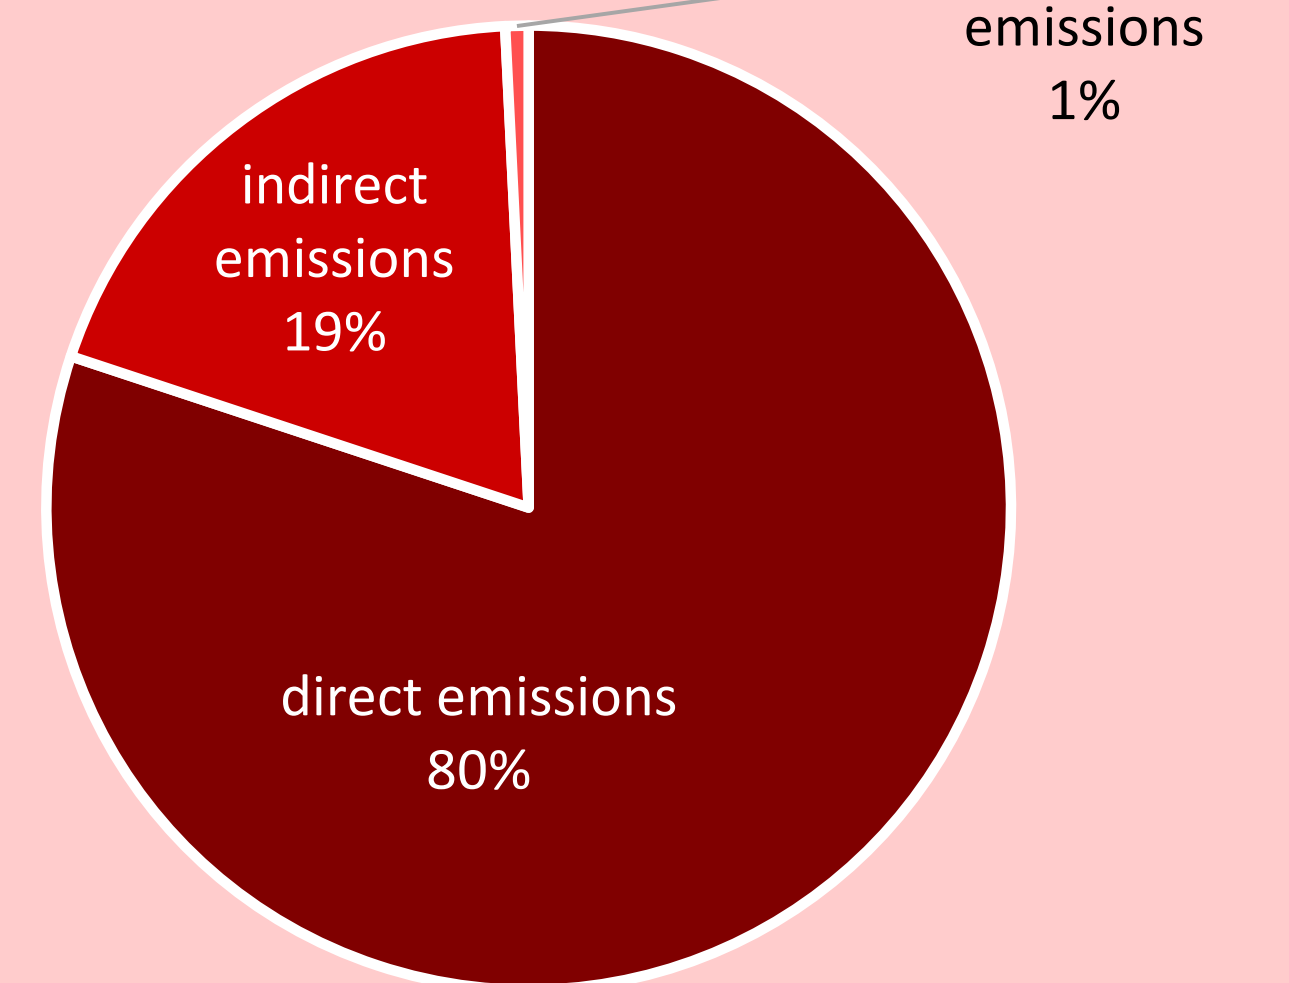

Explore, evaluate, and implement innovative techniques for minimizing the impact of campus emission, effluent and waste streams.

progress toward direct emissions reduction goal

The Institute experienced a 3% reduction in emissions in calendar year 2014. This reduction was due to reduced purchases of electricity from the grid, close to half of which is generated using coal. The installation of an additional megawatt of on-site fuel cells also reduced emissions, as they operate more cleanly than the grid.
